- the first manufacturing industry in the EU, leading in terms of turnover (15.6%), value added (13%) and employment (15.2%)

€1,090 billion
turnover

€212 billion
value added

4.25 million people
direct employment

285,000 SMEs account for:

49.4%
of food and drink
turnover

48.1%
of food and drink
value added

62.8%
of food and drink
employment

99% of food and drink companies are SMEs

... fuelled by the limitations of existing modelling tools

Economic and Food Security Impacts of Agricultural Input Reduction Under the European Union Green Deal's Farm to Fork and Biodiversity Strategies

Jayson Beckman, Maros Ivanic, Jeremy L. Jelliffe,
Felix G. Baquedano, and Sara G. Scott

JRC TECHNICAL REPORT

Modelling environmental and climate ambition in the agricultural sector with the CAPRI model

*Exploring the potential effects of
selected Farm to Fork and
Biodiversity strategies targets in
the framework of the 2030 Climate
targets and the post 2020
Common Agricultural Policy*

Jesus Barreiro-Huete, Mariia Bogonos, Mihaly

Dominguez, Amar Sahoo, Guna Salputra, Franz
Weiss, Edoardo Baldoni, Christian Elleby

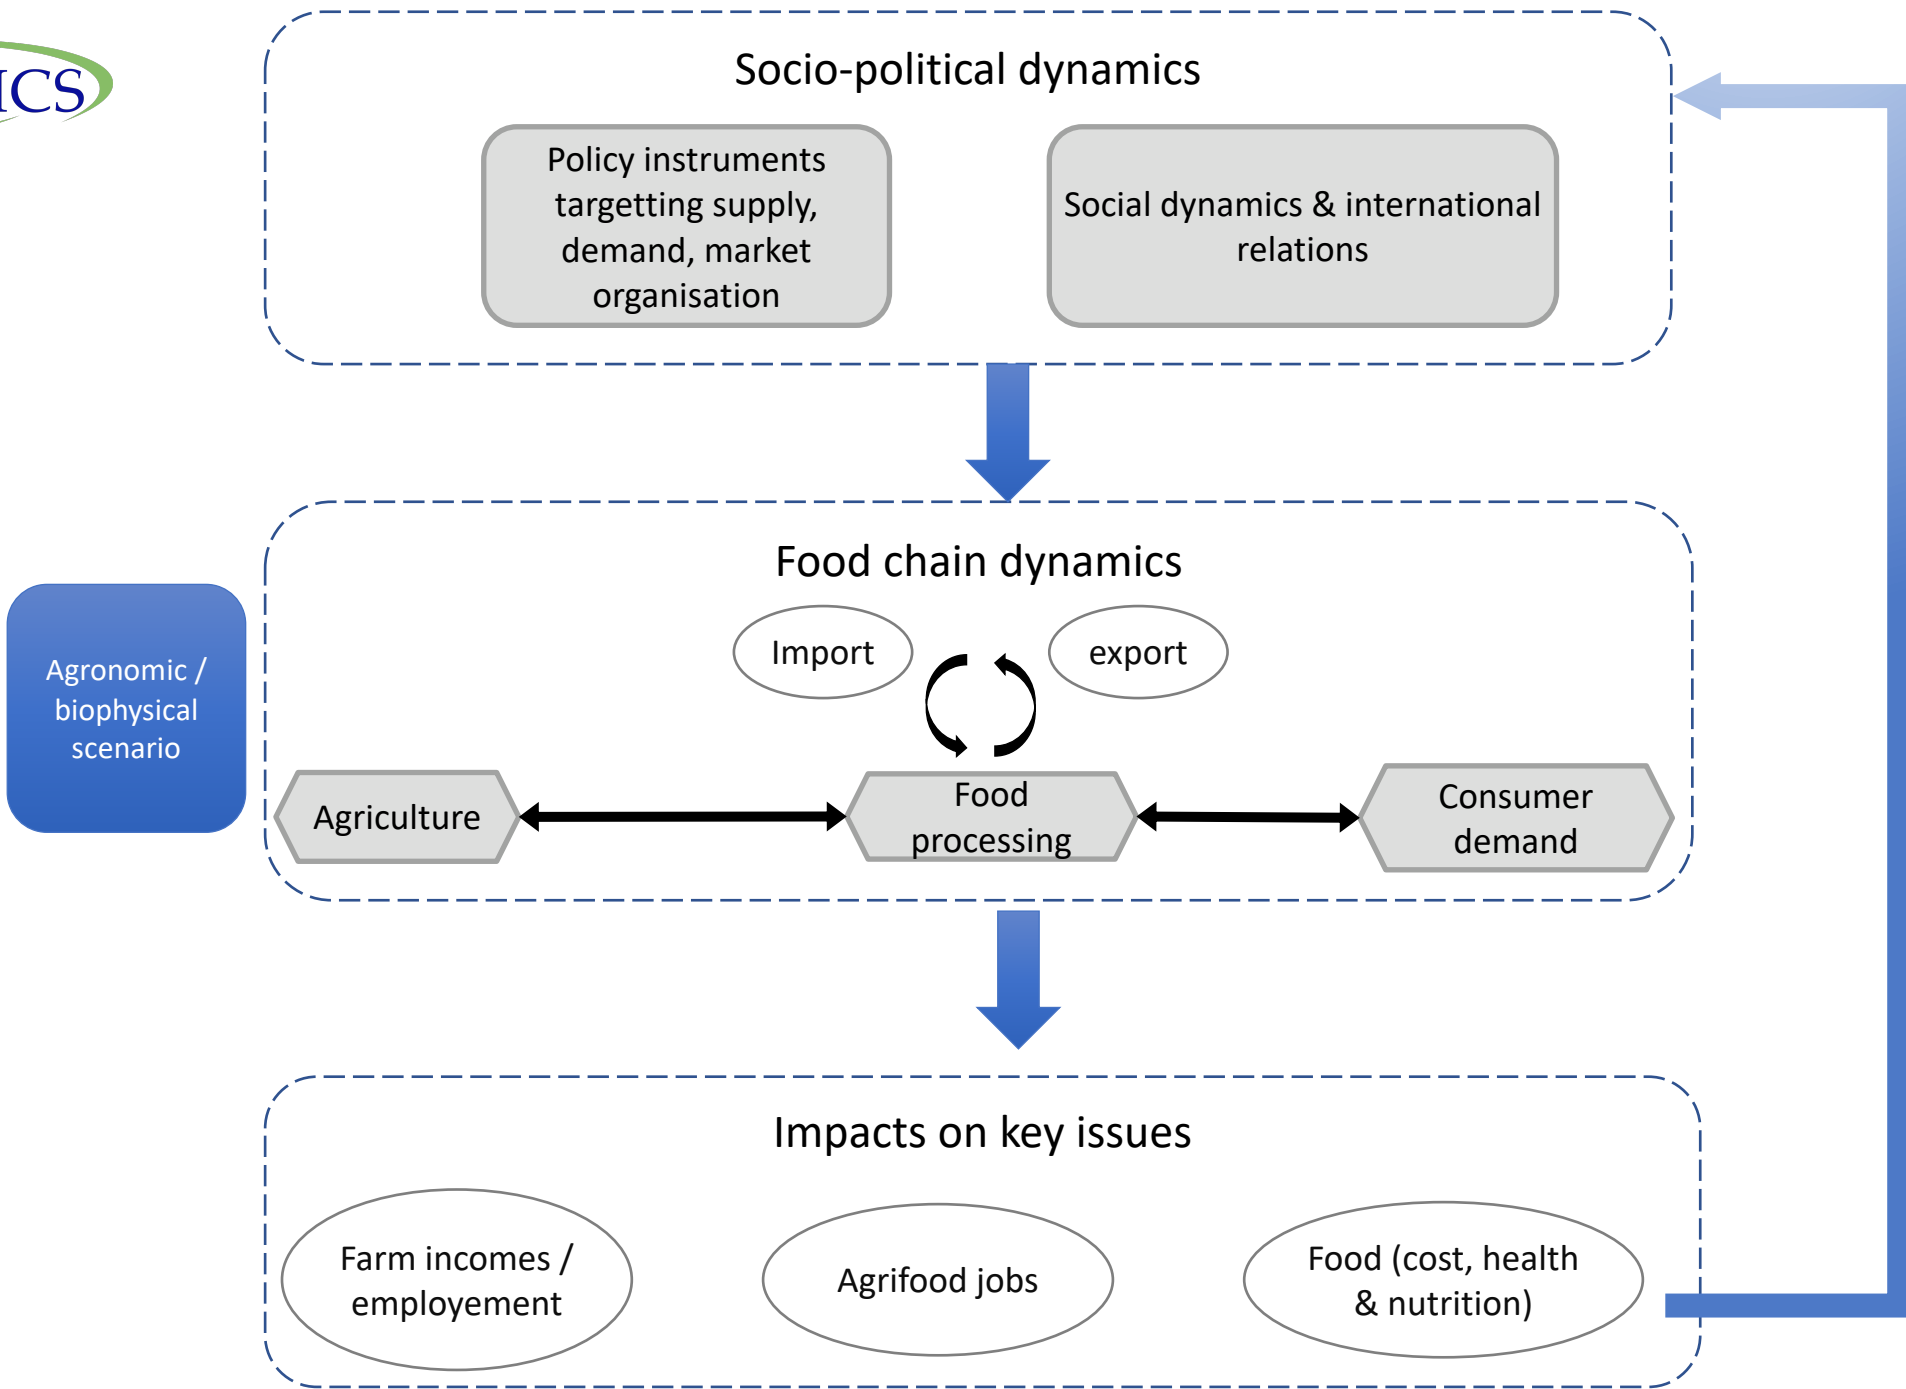

2021

A conceptual approach to identify options for the just transition of food value chains

Holding together biophysical and socio-economic dynamics

- A just transition: the capacity of a transition to a green economy to sustain decent jobs and livelihoods to all
- Developing modelling tools better adapted to address just transition questions
 - ✓ Biophysical models: robust, but unable to consider socio-economic issues
 - ✓ Economic, supply-demand equilibrium models (CAPRI, MAGNET, AgLink COSIMO...): unable to apprehend **structural transformations** of food systems
- Farms, processing industries, consumer behaviours... will be structurally different by 2030 and even more by 2050
- => the need to **couple both dynamics** and to link the functioning of food value chains to the impacts we want to apprehend

How it works?

- $L = LI \times Y$ with
 - L: total labour force employed
 - LI: labour intensity of the production
 - Y: indicator of the production
- Income: evolution of production costs to identify conditions of viability on prices & subsidies – beyond the scope of this presentation

Agriculture

2015

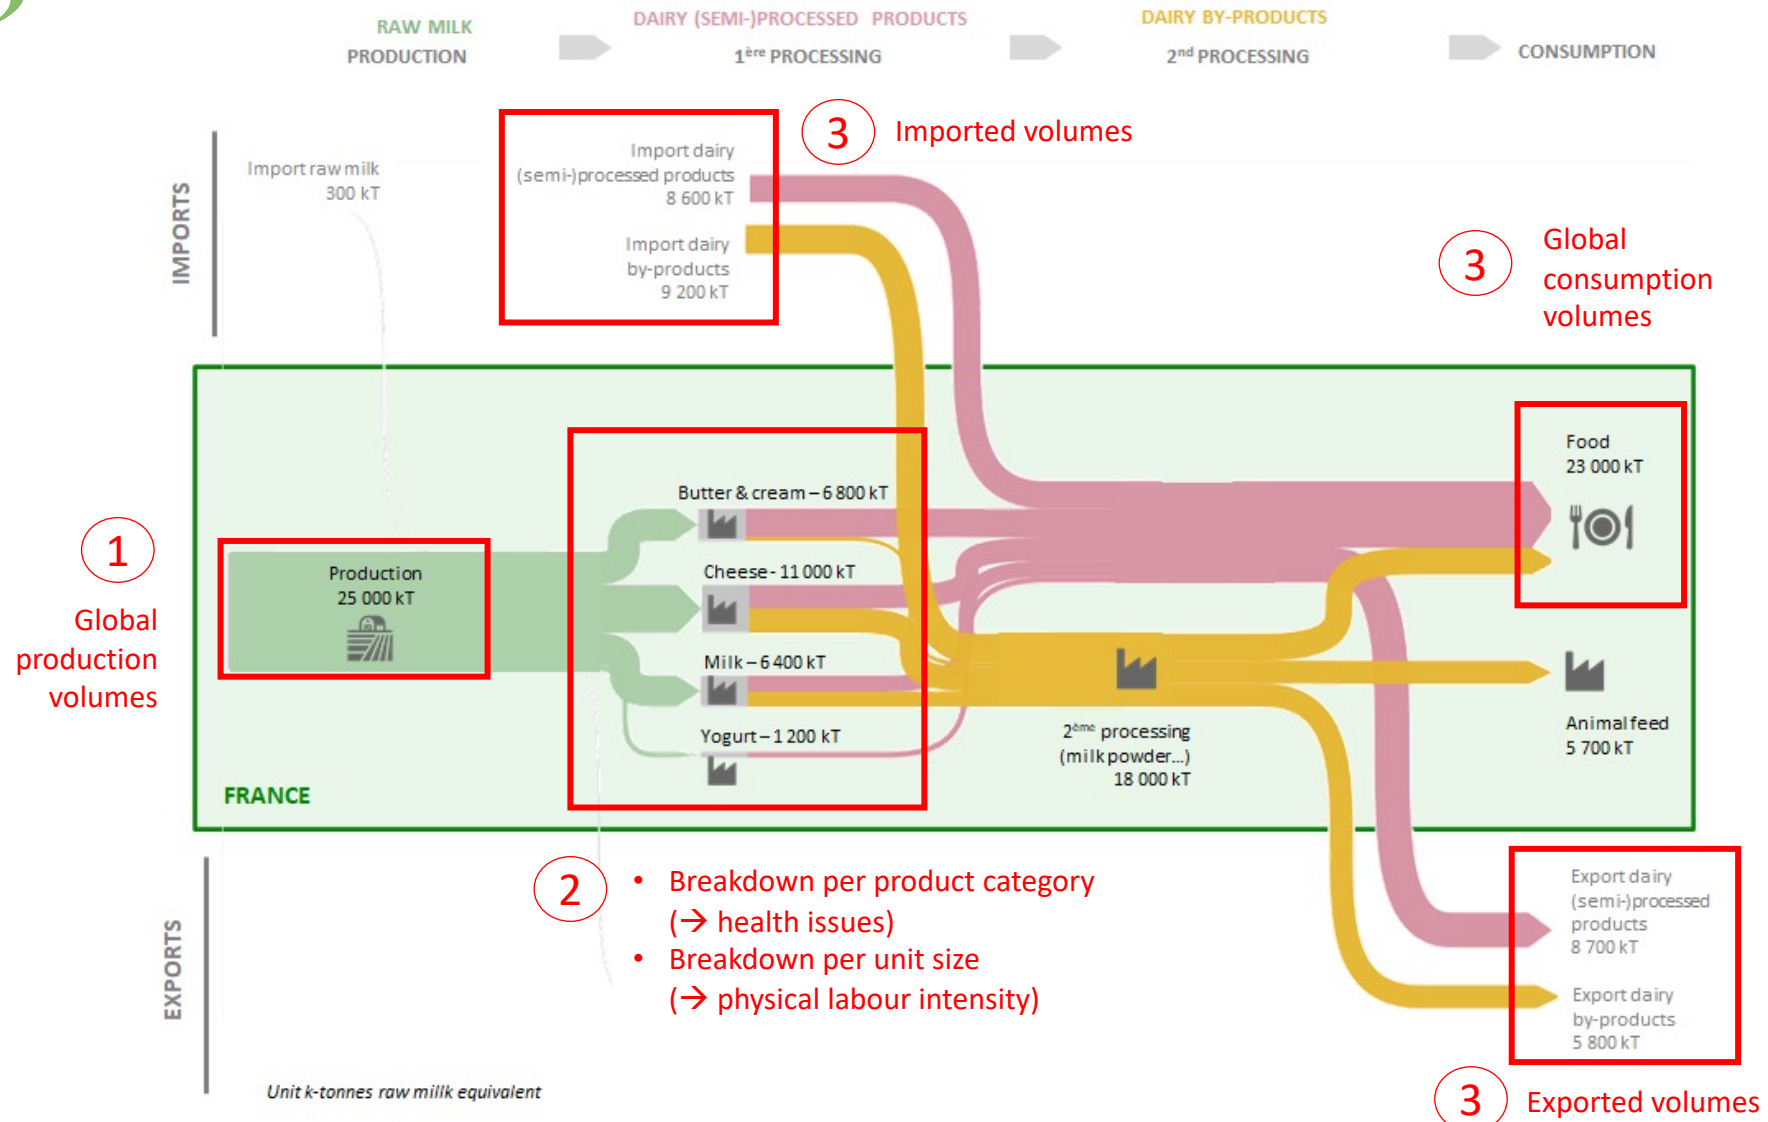

$$L_{2030} = \sum_i (LI - FS_{2030\ i} \times FS_{2030\ i})$$

2. Food industry

$$L_{2030} = \sum_i (LI_{i\ 2030} \times V_{i\ 2030})$$

Data needs to make progress

Data currently available

- At the farm level: FADN data => possible to reconstruct LI, KI
- At the processing industry level: data available does not account for **physical volumes passing through the processing industries**
 - ✓ difficult to link biophysical constraints and socio-economic outcomes
- Other limitations:
 - ✓ Complete data is often available only in an aggregated form at the national level (but see below)
 - ✓ No data regarding the share of differentiated vs commodified / standardized production
 - ✓ When data is available for specific firms:
 - ❑ It is often incomplete (ex. few data on business expenses)
 - ❑ Big firms are often over-represented in the sample

Effectifs DDE-INPI-ORBIS (2017)

10.11Z

The problem of the “legal entity” scale

- When data is available for specific firms (ex. ORBIS, DIANE, AMADEUS databases), it is provided at the “legal entity” scale (structure having juridic personality)
- This means that:
 - Difficult to reconstruct information and business strategies at the “company” scale (for firms belonging to the same company – and there are many)
 - Difficult to analyse specific production processes happening at the “facility scale” – where production happens
 - Ex. How much workload is necessary to produce a certain amount of output in a structure belonging to a firm
 - => not possible to link biophysical fluxes with socio-economic questions
 - Problem of double counting when considering turnover when production is sold to a facility belonging to the same legal entity (and is counted twice in term of turnover)

Firms operating in multiple sectors

- Firms are classed based on their sector of activity. For firms operating in various sectors, all data values are assigned to the dominant sector
- Some of the food processing is also realised by retailers (ex. Cutting and packing meat) -> Difficult to separate their main business from the processing activities

Conclusion

A key issue for further research

With these limits, it becomes difficult to :

- examine precisely scenarios of deep transformations regarding the processing sector
- create typologies of firms based on size, type of production (organic vs conventional), product mix etc.
- realise socio-economic evaluations at the “facility scale” or the “company scale”, which is the most appropriate scale when dealing with production processes
 - ❑ Company scale = scale at which the strategic decisions are taken
 - ❑ Facility scale = scale at which the production takes place (labour intensity)
- Similar issues when looking at trade!
